

Create a program to delete the file if exists, and create again.

```
import java.io.*;

public class Main {

    public static void main(String[] args) {

        try {

            File f = new File("test.txt");

            if (f.exists())

                f.delete();

            f.createNewFile();

            System.out.println("File created successfully");

        } catch (Exception e) {

            System.out.println("Error");

        }

    }

}
```

The screenshot shows a Java IDE with a file named 'Main.java'. The code is as follows:

```
1 import java.io.*;
2
3 public class Main {
4     public static void main(String[] args) {
5         try {
6             File f = new File("test.txt");
7             if (f.exists())
8                 f.delete();
9             f.createNewFile();
10            System.out.println("File created successfully");
11        } catch (Exception e) {
12            System.out.println("Error");
13        }
14    }
15 }
```

The 'Run' button is highlighted. The 'Output' pane shows the result of the execution:

```
File created successfully

=== Code Execution Successful ===
```
